EASY RASTA

Unified Product Specification v2.0

Rewards, Referral, Community Verification & GTM Engine

Version	Status	Supersedes
2.0 — March 2026	**For Developer Handoff**	**v1.0 + all interim decisions**

This document supersedes the v1.0 spec and all decisions made during the product review sessions of March 2026. It consolidates the reward engine, referral system, community verification loop, event sponsorship, garage feature, and 90-day GTM plan into a single build reference. All cash/points decisions from v1.0 have been replaced by the updated ₹-wallet-first model described herein.

1. System Architecture Overview

The Easy Rasta engine has four interconnected layers. Every user action flows through the wallet ledger, which is the single source of truth for all rewards.

Layer	System	What it does
1	Wallet Engine	Single ₹ balance per user. All rewards credited here. Spendable on events and marketplace. No UPI withdrawal at launch.
2	Referral Engine	Deep link attribution. Both referrer and new user earn ₹10 when new user completes first in-app action.
3	Chain of Truth	Scout → Verifier → Corrector loop for fuel prices and toilet status. Pays ₹10/₹5/₹10 per role. 24-hour cooldown governs payouts.
4	Trust Score & Anti-Fraud	Every user has a Trust Score (0–100%). Governs Scout status. Wallet credits frozen if score drops below 70%.
5	Career Milestones & Events	Cumulative achievements, event check-ins, garage records, and service logs. All reward ₹ wallet credits.

Key principle (v2.0): All rewards are ₹ wallet credits. The points layer will be introduced once MAU exceeds 1,000. Wallet credits are app-only — spendable on events and the marketplace. No UPI withdrawal at launch.

2. Reward Structure — Complete Reference

All rewards are credited directly to the user's in-app wallet. ₹ amounts below are final for launch. The points layer described in v1.0 is deferred until MAU > 1,000.

2.1 Daily Wallet Cap

Category	Daily Cap Per User	Notes
Data actions (Scout/Verifier/Corrector/Receipt)	₹50/day	Prevents location farming abuse
Events, referrals, garage, service records	No cap	These cost nothing or are bounded by real-world activity

2.2 Data Contributions — Fuel Bunks

Action	Reward	Conditions & Fraud Guard
Scout — first fuel report *Photo + price + odometer + GPS*	₹10	Receipt OCR required. GPS must match bunk location. Receipt hash deduped globally. First report only, or after a correction.
Verifier — confirms price unchanged *YES tap within 100m*	₹5	Only triggers after 24h cooldown expires. One user earns per cooldown window — first valid GPS tap wins. Cannot verify own Scout report.
Corrector — submits new price *NO tap + full new bundle*	₹10	Original Scout earns ₹0 on correction. New receipt required. Odometer OCR checked — new reading must be higher than last saved.

2.3 Data Contributions — Toilets

Action	Reward	Conditions & Fraud Guard
Scout — first toilet report *Photo + hygiene + access type + GPS*	₹10	Photo hash deduped. GPS must be within 50m of toilet pin. No receipt needed — photo + GPS is proof.
Verifier — confirms status unchanged *YES tap within 100m*	₹5	Same 24h cooldown rule as fuel. One earner per window. GPS required. Cannot verify own Scout report.

Action	Reward	Conditions & Fraud Guard
Corrector — reports change in status *NO tap + new photo + GPS*	₹10	Triggered when Verifier taps NO. New photo required. Original Scout earns ₹0 on correction.

2.4 Cooldown & Payout Logic

The following logic governs when a location triggers a payout. Developer instruction: implement exactly as described.

Situation	Who earns	Amount
First ever report for this location	Scout	₹10
Data changed since last report (confirmed)	Corrector	₹10 (original Scout ₹0)
Data unchanged, last report > 24h old	First valid Verifier only	₹5
Data unchanged, last report < 24h old	Nobody	₹0 — data is fresh
Same user, same location, within cooldown	Blocked	₹0 — GPS + device check

Push notification rule: When a location's cooldown expires (24h since last verification), the system sends a push notification to all users within 2km. Copy: 'Fuel prices at [Bunk Name], [Area] haven't been checked in 24hrs — be the first to verify, earn ₹5.' This notification is the primary MAU driver. Every notification sent = a reason to open the app = a session recorded.

2.5 Fuel Receipts & Mileage Tracking

Action	Reward	Conditions
Fuel receipt uploaded *Per fill-up, any vehicle*	₹5 flat	OCR reads bunk name, amount, timestamp. GPS confirms presence at time of fill. Receipt hash deduped globally. Flat ₹5 at launch — tiered by fill amount in v2.
Odometer reading logged *OCR first, manual fallback*	₹5	New reading must be higher than last saved reading. OCR attempted first. Manual entry allowed if OCR fails — flagged for spot-check. Once per fill-up.

Action	Reward	Conditions
Mileage milestone — every 1,000 km logged	₹5	kmpl calculated from odometer delta divided by total fuel litres across fill-ups. Displayed on profile. Milestone recurs every 1,000 km.

Note: *The kmpl display is a sticky retention feature. Once a user has 3+ fill-ups logged, the app shows their actual fuel efficiency per bike and can compare against the average for their vehicle model. This data is unavailable elsewhere and keeps users uploading receipts consistently.*

2.6 Service Records — Garage

Applies to both motorcycles/scooters and cars. All service rewards require a bill photo. OCR reads workshop name and date.

Action	Reward	Cooldown	Notes
First vehicle added to garage	₹10	Once per vehicle	Applies to first bike and first car added. Encourages full garage setup.
Oil change logged (bike/scooter)	₹5	90 days per bike	Bill photo required. One reward per bike per window.
Oil change logged (car)	₹5	180 days per car	Cars have longer oil change intervals.
Tyre change logged (bike)	₹5	180 days per bike	Bill photo required. Hash deduped.
Tyre change logged (car)	₹5	365 days per car	Annual cooldown matches real tyre life.
General workshop visit	₹5	30 days per vehicle	Catch-all for any service not listed above. Bill photo required.

Note: *Vehicle types at launch: motorcycles, scooters, and cars. Trucks, taxis, and autos are planned for v2 — the data model supports them. Unlock via admin panel when ready.*

2.7 Events

Action	Reward	Conditions
Attendee GPS check-in on the day	₹5	GPS within 200m of event pin. One reward per event per user. RSVP alone does not qualify — physical presence required.

Action	Reward	Conditions
Creator — per confirmed RSVP	₹2	Per RSVP (not just view). Capped at ₹40 per event (20 RSVPs). Awarded on RSVP, not check-in.
Creator — bonus: 10 GPS check-ins	₹20	Check-ins counted, not RSVPs. Awarded once when 10th check-in confirmed.
Creator — bonus: 25 GPS check-ins	₹50	Stacks on 10-attendee bonus. Same event.
Creator — bonus: 50 GPS check-ins	₹100	Stacks on both prior bonuses. Realistic for large organised rides only.

2.8 Event Sponsorship — Sponsored by Easy Rasta

When an event meets the eligibility criteria, Easy Rasta reimburses the organiser's food/drink spend (breakfast, tea, snacks) and displays a 'Sponsored by Easy Rasta' badge on the event listing.

GPS check-ins	Max reimbursement	Per head cap	Eligibility
25–49	₹750	₹30/head	Paid event only. Event must be created on Easy Rasta. Organiser uploads bill photo post-event. Admin approves before wallet credit.
50–99	₹1,500	₹30/head	Same eligibility rules. Bill OCR reads vendor name + amount.
100+	₹2,500	₹25/head	Slight reduction per head at scale. Same rules.

Monthly sponsorship cap: ₹15,000 across all events and all cities. First approved events in the month consume the budget. Admin can pause when cap is reached. Anti-abuse: GPS check-ins require unique device IDs. Suspicious clusters (all within 2 minutes, identical GPS coordinates) are flagged for admin review before reimbursement is paid.

Note: *The 'Sponsored by Easy Rasta' badge is the single most valuable marketing asset in the product. When users share sponsored events on Instagram and WhatsApp, the badge signals legitimacy to new users before they install. Design it prominently.*

3. Referral Engine

3.1 Core Design Rules

- Both referrer and new user earn ₹10 — total cost per referral: ₹20
- ₹10 triggers only when the new user completes any single in-app action — not on install alone
- Attribution window: 30 days from link creation. Link still works after 30 days but earns no reward
- 2-level chain only: referrer earns on direct referrals and one level deeper. No deeper chains

3.2 What Counts as a First Action

Any of the following qualifies. Viewing content alone does not count.

Action	Minimum quality gate
Scout or Verify a fuel bunk	Photo + GPS required for Scout. GPS within 100m for Verifier.
Scout or Verify a toilet	Photo + GPS required for Scout. GPS within 100m for Verifier.
RSVP or check in to an event	RSVP counts. GPS check-in also counts.
Upload a fuel receipt	OCR must read bunk name and amount. GPS confirms presence.
Add a vehicle to garage	Vehicle make + model required. Bare form submission blocked.
Submit a review	Minimum 20 words. Photo encouraged but not required.

3.3 Deep Link Architecture

Every share generates a unique deep link carrying referrer_id + content_type + content_id. This link must survive the Play Store / App Store install redirect.

```
easyrasta.app/r/{referrer_id}?type={fuel|toilet|event|service|gear|direct}&id={content_id}
```

- Recommended tooling: Firebase Dynamic Links or Branch.io
- On new install: app reads referral params from dynamic link on first launch, writes to referral_attributions table before any other action
- Same-device protection: if install happens on same device_id as referrer, no reward awarded

3.4 Share Triggers — What Content Generates a Link

Share trigger	What the link opens	Best channel	Viral potential
Cheap fuel found	Bunk listing with current price + map	Biker WhatsApp groups	Very high
Clean toilet found	Toilet listing with status + photo	Highway rider groups	High
Upcoming ride event	Event page with RSVP button	Instagram stories, WhatsApp	Very high
Sponsored event (badge visible)	Event with Sponsored by Easy Rasta badge	Instagram, Facebook groups	Highest
Service centre review	Workshop listing with reviews	WhatsApp, Reddit bike groups	Medium
Direct referral code	App home with referral attributed	1-to-1 WhatsApp message	Medium

3.5 Referral Anti-Fraud Rules

Attack vector	How it is blocked
Self-referral on second device	Same device fingerprint as referrer = blocked. Same phone number = blocked. Both checks run on install.
Install farming (download without using)	₹10 only triggers on first real action, not on install event. Viewing content alone does not qualify.
Fake first actions	Review must be 20+ words. Scout needs photo + GPS. Garage add requires make + model. Quality gate on every action type.
Chain farming (A→B→C→A loop)	2-level chain only. No circular or deeper chains. Enforced at attribution write time.
Trust Score drop after referral	If referred user's Trust Score drops below 70% within 7 days of install, referrer's ₹10 is frozen pending admin review.
Expired link	Link used after 30 days still opens content but earns no wallet credit. No silent failure — clearly communicated in share copy.

4. Chain of Truth — Verification Logic

4.1 Fuel Price — Recursive Verification Loop

Developer instruction: implement this logic exactly as described.

- When a user opens the app within 100m of a fuel bunk, check last_verified_at for that bunk
- If last_verified_at < 24 hours ago: show Verifier prompt — 'Still ₹[price]? YES / NO'
- If YES: update last_verified_at timestamp only. Do NOT create a new map entry. Credit ₹5 to first Verifier in this cooldown window.
- If NO: launch full Scout workflow (Photo + New Price + Odometer). User becomes Corrector. Credit ₹10. Original Scout earns ₹0.
- If last_verified_at > 24 hours ago OR no record exists: send push notification to nearby users, launch full Scout workflow for whoever responds first
- Low Price Alert: if Corrector's new price is ₹0.50+ below the 10km average, push FCM notification to all users within 10km who have flagged this bunk as a favourite

4.2 Toilet Status — Pulse Check Loop

Field	Values	Notes
access_type	Paid / Unpaid	Set by Scout on initial log
cost	Amount in ₹ (nullable)	Required if access_type = Paid
hygiene_level	Sparkling / Okay / Unclean	1-tap selection by Scout and Corrector
amenities	water, soap, paper (boolean)	Checklist on Scout form
last_verified_at	timestamp	Updated on every YES verification
consecutive_unclean_count	int	Triggers real-time alert to nearby users at 3 consecutive Unclean reports

5. Trust Score & Anti-Fraud

5.1 Trust Score Logic

Formula: trust_score = (total_agreed_verifications / total_reports_submitted) * 100. Stored as a float in the users table. Updated on every verification event.

Event	Effect
New account	Trust Score starts at 100%
Report marked Wrong by 3 verifiers within 1 hour	Trust Score -10% (penalty per incident)
Trust Score drops below 70%	Scout status suspended. Wallet credit earning paused for Scout/Corrector actions. User can still Verify (earn ₹5).
Rehabilitation	Complete 10 successful Verifications to restore Scout status. Trust Score recalculates from full history.
Admin override	Admin can manually reset or flag a location's data via Platform Admin Panel

5.2 Odometer Anti-Cheat

- Every Scout or Corrector fuel submission requires an odometer photo
- App applies OCR to extract odometer reading. Compare against user's last_odometer_reading
- If new reading is LOWER than last saved reading: block the reward. Flag entry for Admin review.
- If OCR fails to read the number: prompt user to retake photo. Do not accept blank odometer.
- Daily cap: maximum ₹50 wallet credit earned per user per 24-hour period from data actions regardless of activity

5.3 Receipt Anti-Fraud

- Every fuel receipt photo is hashed on upload
- Same receipt uploaded twice: flag account, freeze pending wallet credits, notify admin
- Receipt OCR must read: bunk name, amount, timestamp. All three required for reward.
- GPS at time of receipt upload must be within 300m of the bunk listed on the receipt

6. Garage Feature

6.1 Vehicle Types at Launch

Vehicle type	First vehicle reward	Service record rewards
Motorcycles & scooters	₹10 wallet	Oil change ₹5 (90-day cooldown). Tyre change ₹5 (180-day). General service ₹5 (30-day). Bill photo required for all.
Cars	₹10 wallet	Oil change ₹5 (180-day cooldown). Tyre change ₹5 (365-day). General service ₹5 (30-day). Bill photo required for all.

Note: *Trucks, taxis, and auto-rickshaws are planned for v2. The data model supports all vehicle types. Unlock via the admin panel — no code deployment needed.*

6.2 Mileage Tracking

- Odometer readings logged per vehicle across all fuel receipt uploads
- kmpl calculated per vehicle: total km delta divided by total litres purchased
- Displayed on user profile per vehicle — updated after each fill-up
- Comparison benchmark: average kmpl for that vehicle make/model shown alongside user's actual figure
- This data is exclusive to Easy Rasta users and is a strong retention driver for regular uploaders

7. Supabase Database Schema

7.1 users table — add these fields

Field	Type	Purpose
wallet_balance	int default 0	Running total of all wallet credits in paise (₹1 = 100). Store as integer to avoid float rounding.
trust_score	float default 100	(agreed_verifications / total_reports) * 100. Governs Scout status.
scout_status	enum	active | suspended | probation. Set by trust_score threshold.
total_kms_verified	float default 0	Cumulative odometer delta across all vehicles and trips.
scout_reports_count	int default 0	Total Scout submissions (fuel + toilet).
verification_actions_count	int default 0	Total YES/NO verification taps.
last_odometer_reading	int nullable	OCR value from last Scout submission per vehicle. Used for anti-cheat.
referral_code	varchar unique	User's shareable code. Generated on account creation.
referred_by_user_id	uuid nullable FK	Set on install if deep link attribution is found.
last_active_at	timestamp	Updated on any in-app action. Used for 12-month inactivity expiry.

7.2 referral_attributions table — new table

Field	Type	Purpose
id	uuid PK	Primary key
referrer_user_id	uuid FK	User who shared the link
referred_user_id	uuid FK	New user who installed
content_type	enum	fuel | toilet | event | service | gear | direct
content_id	uuid nullable	ID of specific content shared
status	enum	pending | first_action_complete | credited | expired | frozen

Field	Type	Purpose
referrer_credit	int	Amount credited to referrer in paise (0 until status = credited)
referred_credit	int	Amount credited to new user in paise (0 until status = credited)
first_action_type	varchar	Which action completed the referral — critical for onboarding analytics
created_at	timestamp	Link creation time — attribution window starts here
first_action_at	timestamp	When new user completed their first action
expires_at	timestamp	created_at + 30 days

7.3 fuel_bunks table — add these fields

- last_verified_at: timestamp — updated on every YES verification
- verified_count_today: int — count of verifications in last 24hrs for Trust Meter UI
- current_price: float — set by Scout or Corrector
- boost_active_until: timestamp — set when Bunk Manager hits Boost. Expires after 24hrs.

7.4 toilets table — add these fields

- access_type: enum (paid | unpaid)
- cost: float nullable
- hygiene_level: enum (sparkling | okay | unclean)
- amenities: jsonb {water: bool, soap: bool, paper: bool}
- last_verified_at: timestamp
- consecutive_unclean_count: int — triggers real-time alert at 3

7.5 wallet_transactions table — new table

- id: uuid PK
- user_id: uuid FK
- amount: int — in paise. Positive = credit, negative = debit
- type: enum (scout_fuel | scout_toilet | verifier_fuel | verifier_toilet | corrector | receipt_upload | odometer | event_checkin | event_creator | event_sponsorship | referral_referrer | referral_referred | service_record | garage_add | milestone)
- reference_id: uuid nullable — ID of the source record (bunk, toilet, event, referral, etc.)
- status: enum (pending | confirmed | frozen | reversed)

- created_at: timestamp

Note: *Store all wallet amounts in paise (integer) to avoid float arithmetic errors. ₹10 = 1000 paise.*

8. Admin Panel Requirements

8.1 Wallet & Reward Controls

- Admin can adjust wallet credit amounts per action type without app redeployment
- Admin can set and adjust the daily ₹50 cap
- Admin can freeze or unfreeze individual user wallets
- Admin can manually credit or debit a user's wallet with a reason log
- Admin can view real-time wallet liability: total credits issued vs redeemed this month

8.2 Sponsorship Controls

- Admin approves or rejects event sponsorship reimbursement requests
- Admin sets the monthly sponsorship cap (default ₹15,000)
- Admin can see current month spend vs cap at a glance
- Admin can pause sponsorship approvals when cap is reached
- Suspicious check-in clusters are flagged automatically and appear in admin review queue

8.3 Trust Score Controls

- Admin can manually reset a user's Trust Score with a reason log
- Admin can manually approve or reject Scout entries from suspended users
- Admin can reset a location's price/status if a fake report is confirmed

8.4 Bunk Manager Dashboard

- Bunk Manager can update fuel price, services, and amenities
- Bunk Manager can trigger Boost (once per 24 hours) — bypasses 24-hour grey rule, displays 'Verified by Manager' badge
- Bunk Manager can scan and validate user QR discount codes
- Bunk Manager sees analytics: visits, direction taps, verification count, user ratings

9. Go-To-Market Plan — 90 Days

Launch city: Bengaluru. Second city: Pune or Hyderabad (one only, Days 31–60). Third city: Chennai or Mumbai (Days 61–90). Primary community: biker clubs and riding groups. Cars added in month two.

Phase 1 — Days 1 to 30: Seed the community

Goal: 200 real users. First fuel + toilet data live on 2 Bengaluru corridors.

- Identify 3 active Bengaluru biker clubs via Instagram. Look for clubs that post ride photos with 50+ comments. DM the admin directly — not a group post.
- Offer each club admin: their next group ride listed free on Easy Rasta + ₹750 breakfast sponsorship if 25+ members check in. They promote to their WhatsApp group. You get installs.
- Pre-seed two high-traffic biker corridors (Hosur Road, Tumkur Road) before launch. Scout every fuel bunk and dhaba toilet on those corridors manually. The app must have real data on day one — an empty map kills first impressions immediately.
- Set up and fully test the Razorpay wallet credit flow before any public launch. Test: Scout submits → wallet gets ₹10 → user spends it on event ticket. End-to-end.
- Do not launch referrals until at least 50 active users are on the platform. Referral viral loops only work if the person receiving the link sees a live, populated app.

Phase 2 — Days 31 to 60: Prove the loop

Goal: 500 MAU. Wallet credits flowing. 1 sponsored event completed and documented.

- Run the first sponsored breakfast ride. Document it thoroughly — photo of the group, receipt, Easy Rasta badge on the event listing. Post it on your Instagram. This is your proof-of-concept story for every subsequent club approach.
- Start one second city only — Pune or Hyderabad, not both. Same playbook: 2–3 clubs via Instagram DM, same sponsorship offer. Do not spread across both metros simultaneously.
- Activate fuel receipt cashback (₹5 per fill-up) only after you can verify that event commission revenue is covering it. Check the economics before switching it on.
- Add cars to the garage. Target car enthusiast clubs — track day groups, modified car owners. Same Instagram DM approach as biker clubs.
- Switch on the referral system once you have 200+ active users and the wallet credit flow is proven stable for 2+ weeks.

Phase 3 — Days 61 to 90: Scale what is working

Goal: 1,000 MAU across 3 cities. Investor narrative data ready.

- At 1,000 MAU, introduce the points layer alongside wallet credits. Points power leaderboards and badges — they cost nothing but drive daily opens and give you a second engagement currency.
- Third metro: Chennai or Mumbai. By now you have a repeatable club outreach playbook. Hand it to a part-time community manager in that city rather than running it yourself.
- First drag race or autocross event listing: find an existing car club that already runs these events. You host the listing and ticketing, they run the event. Easy Rasta gets commission and brand association with zero operational risk.
- Build the investor deck data slide. Track and report: MAU growth curve, wallet credits issued vs redeemed, data points added per week per city, sponsored events run, referral conversion rate. These numbers tell the story if the product is working.

9.1 Unit Economics Checkpoint

Before switching on fuel receipt cashback, verify this equation is positive:

```
Monthly event commission revenue > (Active users × avg fill-ups/week × 4 weeks
× ₹5 cashback)
```

Example: 500 users × 2 fill-ups/week × 4 weeks × ₹5 = ₹20,000/month cashback cost. You need at least ₹20,000 in event commissions before activating receipt cashback at that user base.

10. Decisions Made — v1.0 vs v2.0

This section records every decision that changed between the original v1.0 spec and this document.

Topic	v1.0 said	v2.0 resolves as
Reward currency	Explorer Points (no cash value)	₹ wallet credits only at launch. Points layer deferred to MAU > 1,000.
Verifier reward — fuel	50 Explorer Points	₹5 wallet credit
Verifier reward — toilet	25 Explorer Points	₹5 wallet credit (aligned with fuel)
Scout reward	1 Spin Ticket	₹10 wallet credit
Referral reward	150–200 Explorer Points, referrer only	₹10 wallet to referrer + ₹10 wallet to new user. Flat regardless of content type.
Referral completion trigger	First meaningful action	Any single in-app action. Quality gates on each action type prevent gaming.
Spin the Wheel	Central reward delivery mechanism	Deferred. Wallet credits replace Spin at launch. Spin may return as a bonus mechanic post-1,000 MAU.
Cooldown period	12 hours (fuel)	24 hours (fuel and toilet). Aligns better with real daily usage patterns.
Garage vehicle types	Not specified	Motorcycles, scooters, and cars at launch. Trucks/taxis/autos in v2.
Event sponsorship	Not in v1.0	Reimbursement up to ₹2,500 per event based on GPS check-in count. Monthly cap ₹15,000.
Trust Score rehabilitation	10 verifications	10 successful Verifications restores Scout status. Unchanged.

11. Bunk Amenities, Offers & Cold Start Strategy

This section defines how bunk profile data — amenities and active offers — is collected, verified, displayed, and eventually owned by vendors. It solves the cold start problem: users see useful data from day one without requiring any vendor to log in first.

Core principle: Community data goes live immediately, labelled clearly by source. Vendors are not needed to populate the app at launch. When vendors do onboard, they find their bunk already has data, views, and community engagement — which becomes the sales pitch that gets them to claim it.

11.1 The Cold Start Problem & How It Is Solved

Vendors will not onboard if there are no users. Users will not find value if bunk listings are empty. The solution is a three-state data model where community-contributed data fills the gap at launch, and vendor-posted data replaces it over time. The key insight is that community-spotted offers go live immediately — there is no pending or blocked state waiting for vendor approval.

11.2 Offer Data States — Three Levels of Trust

Every offer on a bunk listing has one of three states. The state determines the badge colour and label shown to users on the bunk card.

State	Badge shown	Who created it	User-facing label
Community suggested	Amber — Spotted by rider	Community scout	Spotted by a rider [photo thumbnail]. Offer text extracted via OCR where possible. Goes live immediately.
Vendor confirmed	Green — Confirmed by bunk	Vendor (claims existing)	Confirmed by [Bunk Name]: [offer text]. Vendor can add expiry date when confirming.
Vendor posted	Purple — Posted by bunk	Vendor (direct post)	Official offer from [Bunk Name]: [offer text]. Richest data — terms, dates, loyalty programme info.
Expired / removed	Not shown to users	Auto or vendor	Community spotted: auto-expires after 7 days unless re-confirmed. Vendor posted: expires on vendor-set date or 30 days if none given.

Note: *Important:*

11.3 Amenity Types — Community Can Add to Any Bunk

Scouts can add any of the following amenity tags to a bunk listing. Each requires a photo as proof. Permanent fixtures (physical infrastructure) never expire. Time-sensitive amenities require periodic re-confirmation via push notification.

Amenity	Photo required	Expiry / refresh	Notes
Air pump	Photo of pump	Never expires	Physical fixture. Permanent once confirmed by 2 scouts.
EV charging	Photo of charger	Never expires	Note charger type if visible (Type 2, CCS). High value for EV riders.
Clean loo on premises	Auto from toilet data	Pulls from toilet listing	Auto-populated if a verified toilet Scout report exists within 50m of the bunk. No separate submission needed.
Food / dhaba	Photo of stall or menu	90-day re-confirm	Food stalls change. Re-confirm push notification sent to nearby scouts after 90 days.
24hr open	Timestamped night photo	180-day re-confirm	Higher bar: photo must be timestamped between 10pm and 5am to qualify. Prevents guessing or assumptions.
Car wash	Photo of facility	Never expires	Physical fixture. Permanent once confirmed.
Tyre repair / puncture	Photo of shop or signage	90-day re-confirm	Small roadside shops open and close seasonally. Re-confirm prompt after 90 days.
Oil / quick service	Photo of service bay	90-day re-confirm	Subject to seasonal closure — same re-confirm cadence as tyre repair.

11.4 Rewards — Bunk Profile & Offer Contributions

These rewards are in addition to the Scout/Verifier/Corrector rewards for fuel price and toilet data. A single bunk visit can earn multiple rewards if the user completes multiple actions.

Action	Reward	Conditions
First scout to complete a full bunk profile *Name + brand + 2 amenities + 1 offer*	INR 15	One-time per bunk. Profile complete = bunk name confirmed + brand identified + 2 amenity photos + 1 offer spotted. Highest single reward to drive thorough first reports.

Action	Reward	Conditions
Adding a new amenity tag to existing bunk *Photo required*	INR 3	Only for amenities not previously listed. Cannot re-add an existing tag for reward. Photo hash deduped globally.
Spotting a new offer (photo of banner, board, or screen)	INR 5	Photo required. OCR attempts to extract offer text automatically. Offer must not already be listed. One reward per offer per user.
Re-confirming a time-sensitive amenity after expiry prompt *Food, tyre, oil — 90-day refresh cycle*	INR 3	Only paid when app sends re-confirm push notification. New photo required. Confirms amenity is still present.

Note: *Combination example:*

11.5 Vendor Onboarding Bridge

The cold start strategy creates a natural vendor sales pipeline without any outbound effort at launch. When a vendor signs up and claims their bunk, they find it already populated with community data, amenity tags, and an offer or two — along with a view count showing how many riders have seen the listing.

When a vendor claims their listing they can: confirm or correct existing community-spotted amenities, confirm or deny community-spotted offers, post new offers directly with expiry dates, trigger the Boost feature once per 24 hours, and see analytics including visits, direction taps, verification count, and community rating.

Vendor outreach trigger (admin panel): When a bunk reaches 3 or more confirmed amenity tags AND 50 or more profile views in a calendar month, flag it as Ready to approach in the admin panel. This gives a warm lead list — bunks where the community has already done the work and the vendor has something tangible to lose by not claiming the listing.

Note: *Vendor sales copy:*

11.6 Database — New Fields & Tables

bunk_offers table — new table

Field	Type	Purpose
id	uuid PK	Primary key
bunk_id	uuid FK	Links to fuel_bunks table
source	enum	community_spotted | vendor_confirmed | vendor_posted
submitted_by	uuid FK nullable	User who spotted the offer. Null if vendor posted directly.
offer_text	varchar	OCR-extracted or vendor-entered offer description
photo_url	varchar nullable	Community photo. Required for community_spotted. Optional for vendor posts.
photo_hash	varchar nullable	SHA-256 dedup. Prevents same photo resubmitted for reward.
status	enum	active | expired | vendor_denied | admin_removed
expires_at	timestamp	Community spotted: created_at + 7 days. Vendor posted: vendor-set date or created_at + 30 days.
wallet_credited	boolean default false	Whether the INR 5 scout reward has been paid for this offer submission.
created_at	timestamp	Submission time

fuel_bunks table — additional fields

- amenities: jsonb — {air_pump: bool, ev_charging: bool, clean_loo: bool, food: bool, open_24hr: bool, car_wash: bool, tyre_repair: bool, oil_service: bool}
- amenities_last_verified: jsonb — per-amenity timestamps for re-confirm expiry logic. Example: {food: '2026-03-01', tyre_repair: '2026-01-15'}
- profile_complete: boolean default false — true when bunk has name, brand, 2+ amenity photos, and 1+ offer. Used for full-profile reward eligibility.
- vendor_claimed: boolean default false — set when a vendor claims the listing via their dashboard
- vendor_claimed_at: timestamp nullable — records when vendor claimed the listing
- profile_views_this_month: int default 0 — running count reset on the 1st of each month. Used for vendor outreach trigger in admin panel.
